

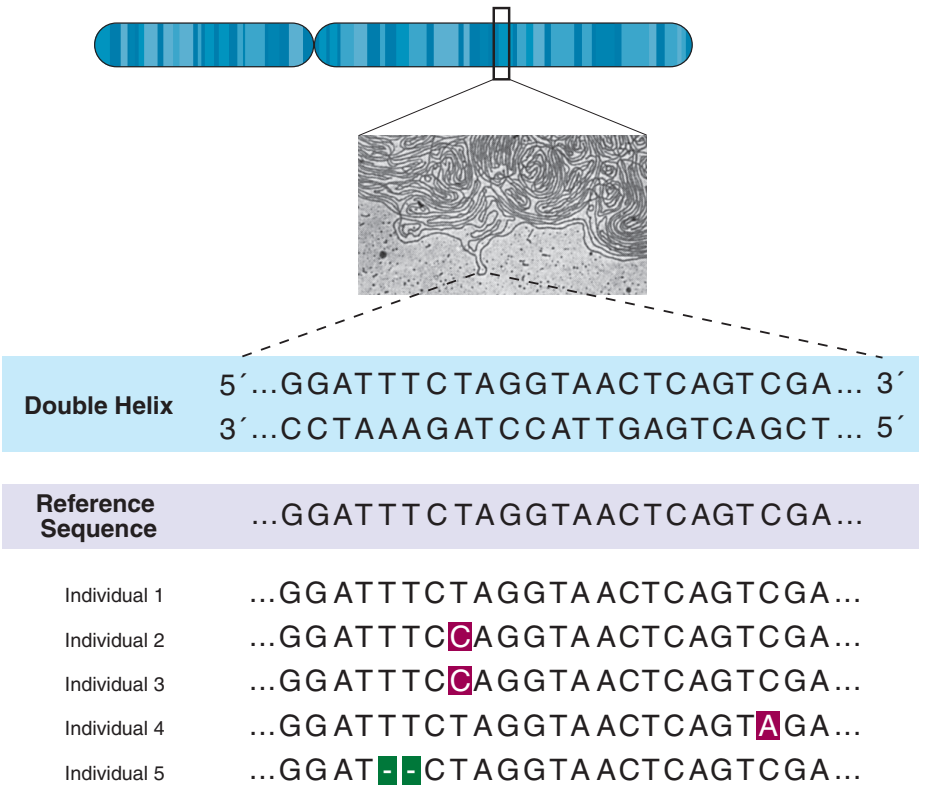

Figure 2-6 **A portion of the reference human genome sequence.** By convention, sequences are presented from one strand of DNA only, because the sequence of the complementary strand can be inferred from the double-stranded nature of DNA (shown above the reference sequence). The sequence of DNA from a group of individuals is similar but not identical to the reference, with single nucleotide changes in some individuals and a small deletion of two bases in another.

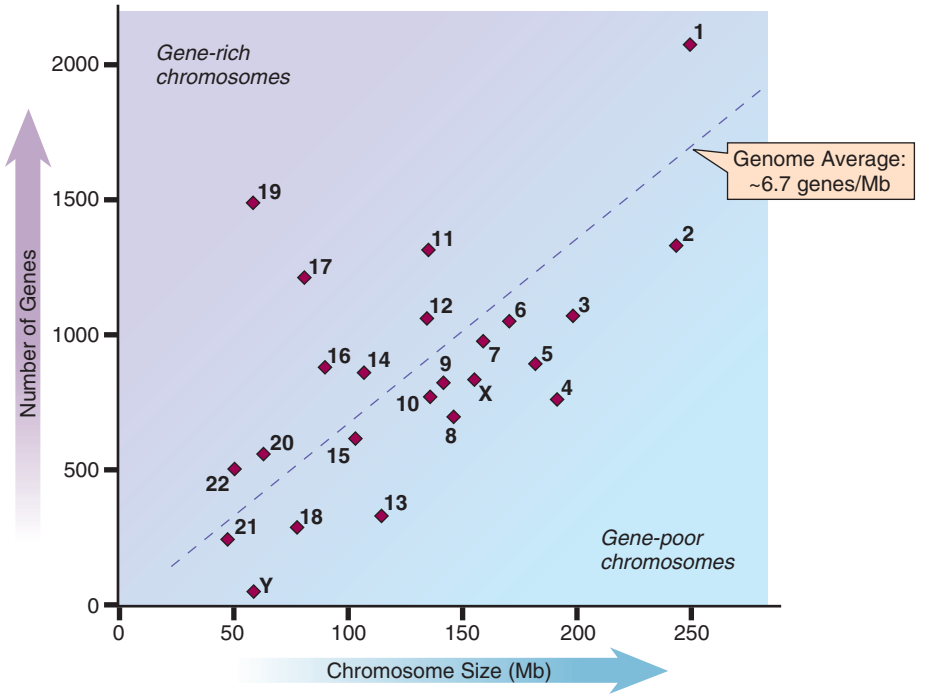

Figure 2-7 **Size and gene content of the 24 human chromosomes.** *Dotted diagonal line* corresponds to the average density of genes in the genome, approximately 6.7 protein-coding genes per megabase (Mb). Chromosomes that are relatively gene rich are above the diagonal and trend to the upper left. Chromosomes that are relatively gene poor are below the diagonal and trend to the lower right. *See Sources & Acknowledgments.*
